

DIY PUMPKIN CLOCK

Supplies:

- A small pumpkin
- A potato clock

Steps:

1. Use a small knife to cut two small holes for the zinc and copper strips. Be sure to use an adult!
2. Push through the pumpkin and see how the time works! Use this potato clock on different fruits and vegetables to see if you get different results!

The particles inside the pumpkin help make the chemical energy in the strips of metal into electrical energy. The electrical current is powering the clock!
